# 7.1 Introduction

## ■ Pointers

- **Powerful, but difficult to master**
- **Simulate call-by-reference**
- **Close relationship with arrays and strings**

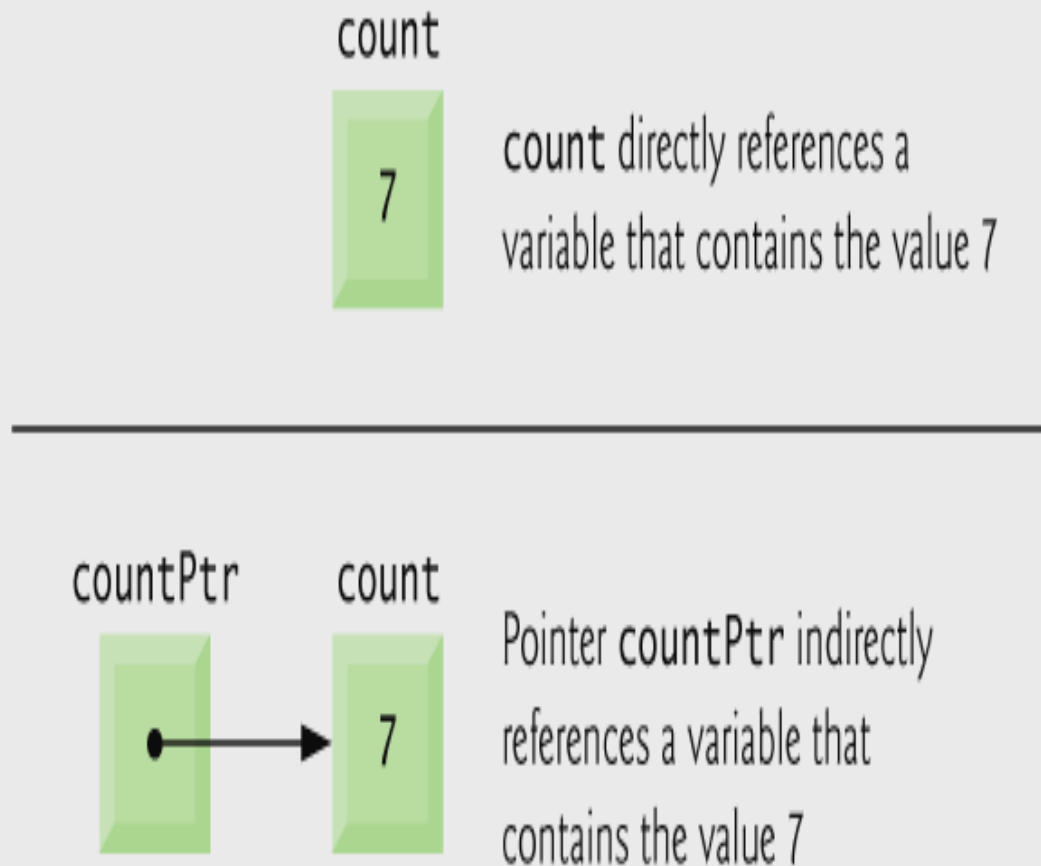

## 7.2 Pointer Variable Definitions and Initialization

### ■ Pointer variables

- Contain memory addresses as their values
- Normal variables contain a specific value (direct reference)
- Pointers contain address of a variable that has a specific value (indirect reference)
- Indirection – referencing a pointer value

CONFUSION

**Fig. 7.1** | Directly and indirectly referencing a variable.

## 7.2 Pointer Variable Definitions and Initialization

### ■ Pointer definitions

- \* used with pointer variables

```
int *myPtr;
```

- Defines a pointer to an `int` (pointer of type `int *`)
- Multiple pointers require using a `*` before each variable definition

```
int *myPtr1, *myPtr2;
```

- Can define pointers to any data type
- Initialize pointers to 0, NULL, or an address
  - 0 or NULL – points to nothing (NULL preferred)

# Common Programming Error 7.1

---

**The asterisk (\*) notation used to declare pointer variables does not distribute to all variable names in a declaration. Each pointer must be declared with the \* prefixed to the name; e.g., if you wish to declare xPtr and yPtr as int pointers, use `int *xPtr, *yPtr;`.**

# Good Programming Practice 7.1

---

**Include the letters `ptr` in pointer variable names to make it clear that these variables are pointers and thus need to be handled appropriately.**

# Error-Prevention Tip 7.1

---

**Initialize pointers to prevent unexpected results.**

# Assignment revisited — Pointers and Vars

---

**X = 17;**

*lvalue = rvalue*

*lvalue: expression that evaluates to a location*

*rvalue: expression that evaluates to a value*

# Simple Pointers

**Pointer is a value that points to a location in the memory**

**Pointer is associated with a type**

```
int number ;
```

```
int * ptr_to_num ;
```

```
number = 23;
```

```
ptr_to_num = & number;
```

```
printf("Value is %d \n", (*ptr_to_num) );
```

# More Pointers

```
int number ;  
int * p1, * p2;  
  
p1 = & number ;  
number = 23;  
p2 = & number ;  
printf(" *p1 = %d   *p2 = %d ", *p1, *p2);
```

*/\* Output ?? \*/*

# Pointers and Arrays

---

```
char str[32];
```

```
char *ptr;
```

```
ptr = str ;
```

```
strcpy( str, "test" );
```

```
strcpy( ptr, "test" );    /* does the same as above */
```

# Pointers and Arrays

```
int table [8];
```

```
int *ptr ;
```

```
ptr = table ;
```

```
table [ 4 ] = 94;
```

```
*( ptr + 4 ) = 94;
```

How about

**ptr = & table[0]?? vs. ptr=table;??**

# Pointer operations

---

**Can add and subtract numbers (like array indices)**

**Can increment and decrement!**

```
char str[] = "Test";
```

```
char * p ;
```

```
int i;
```

```
for( p = str, i=0; *p != '\0'; p++, i++);
```

```
printf(" The length of the string is %d ", i);
```

Interesting Example!

# NULL pointer

## A way to tell that pointer points to nothing

```
void main()
{
    char *msg = NULL;
    MyPrint( msg );
}

void MyPrint( char * txt )
{
    if ( txt == NULL )
        printf( "Invalid parameters: NULL pointer received\n");
    else
        printf( "%s\n", txt );
}
```

# Command Line Arguments

---

```
/* MyProg.c */
```

```
int main ( int argc , char *argv[] )
```

```
{ ...
```

```
> myProg  one  two  three
```

```
argc = 4
```

```
argv[0] = "myProg"
```

```
argv[1] = "one"
```

```
argv[2] = "two"
```

```
argv[3] = "three"
```

```
argv[4] = NULL
```

## 7.3 Pointer Operators

- **& (address operator)**

- **Returns address of operand**

```
int y = 5;
```

```
int *yPtr;
```

```
yPtr = &y;      /* yPtr gets address of y */
```

```
yPtr “points to” y
```

**Fig. 7.2** | Graphical representation of a pointer pointing to an integer variable in memory.

**Fig. 7.3** | Representation of `y` and `yPtr` in memory.

## 7.3 Pointer Operators

- **\* (indirection/dereferencing operator)**

- Returns a synonym/alias of what its operand points to
- `*yptr` returns `y` (because `yptr` points to `y`)
- `*` can be used for assignment
  - Returns alias to an object

`*yptr = 7; /* changes y to 7 */` Key Line!

- Dereferenced pointer (operand of `*`) must be an lvalue (no constants)

- **\* and & are inverses**

- They cancel each other out

## Common Programming Error 7.2

---

**Dereferencing a pointer that has not been properly initialized or that has not been assigned to point to a specific location in memory is an error. This could cause a fatal execution-time error, or it could accidentally modify important data and allow the program to run to completion with incorrect results.**

## Outline

fig07\_04.c

(1 of 2)

```

1  /* Fig. 7.4: fig07_04.c
2     Using the & and * operators */
3  #include <stdio.h>
4
5  int main( void )
6  {
7     int a;          /* a is an integer */
8     int *aPtr;      /* aPtr is a pointer to an integer */
9
10    a = 7;
11    aPtr = &a;      /* aPtr set to address of a */
12
13    printf( "The address of a is %p"
14           "\nThe value of aPtr is %p", &a, aPtr );
15
16    printf( "\n\nThe value of a is %d"
17           "\nThe value of *aPtr is %d", a, *aPtr );
18
19    printf( "\n\nShowing that * and & are complements of "
20           "each other\n&*aPtr = %p"
21           "\n*&aPtr = %p\n", &*aPtr, *&aPtr );
22
23    return 0; /* indicates successful termination */
24
25 } /* end main */

```

If **aPtr** points to **a**, then **&a** and **aPtr** have the same value.

**a** and **\*aPtr** have the same value

**&\*aPtr** and **\*&aPtr** have the same value

## Outline

fig07\_04.c

(2 of 2 )

The address of a is 0012FF7C  
The value of aPtr is 0012FF7C

The value of a is 7  
The value of \*aPtr is 7

Showing that \* and & are complements of each other.

&\*aPtr = 0012FF7C

\*&aPtr = 0012FF7C

| Operators              | Associativity | Type           |
|------------------------|---------------|----------------|
| () []                  | left to right | highest        |
| + - ++ -- ! * & (type) | right to left | unary          |
| * /                    | left to right | multiplicative |
| + -                    | left to right | additive       |
| < <= > >=              | left to right | relational     |
| == !=                  | left to right | Equality       |
| &&                     | left to right | logical and    |
|                        | left to right | logical OR     |
| ?:                     | right to left | conditional    |
| = += -= *= /= %=       | right to left | assignment     |
| ,                      | left to right | comma          |

**Fig. 7.5** | Operator precedence.

## 7.4 Calling Functions by Reference

- **Call by reference with pointer arguments**
  - Pass address of argument using & operator
  - Allows you to change actual location in memory
  - Arrays are not passed with & because the array name is already a pointer
- **\* operator**
  - Used as alias/nickname for variable inside of function

```
void double( int *number )
{
    *number = 2 * ( *number );
}
```
  - **\*number** used as nickname for the variable passed

## Outline

fig07\_06.c

```
1  /* Fig. 7.6: fig07_06.c
2     Cube a variable using call-by-value */
3  #include <stdio.h>
4
5  int cubeByValue( int n ); /* prototype */
6
7  int main( void )
8  {
9     int number = 5; /* initialize number */
10
11    printf( "The original value of number is %d", number );
12
13    /* pass number by value to cubeByValue */
14    number = cubeByValue( number );
15
16    printf( "\nThe new value of number is %d\n", number );
17
18    return 0; /* indicates successful termination */
19
20 } /* end main */
21
22 /* calculate and return cube of integer argument */
23 int cubeByValue( int n )
24 {
25     return n * n * n; /* cube local variable n and return result */
26
27 } /* end function cubeByValue */
```

The original value of number is 5  
The new value of number is 125

# Common Programming Error 7.3

---

**Not dereferencing a pointer when it is necessary to do so in order to obtain the value to which the pointer points is a syntax error.**

## Outline

fig07\_07.c

```

1  /* Fig. 7.7: fig07_07.c
2     Cube a variable using call-by-reference with a pointer argument */
3
4  #include <stdio.h>
5
6  void cubeByReference( int *nPtr ); /* prototype */
7
8  int main( void )
9  {
10     int number = 5; /* initialize number */
11
12     printf( "The original value of number is %d", number );
13
14     /* pass address of number to cubeByReference */
15     cubeByReference( &number );
16
17     printf( "\nThe new value of number is %d\n", number );
18
19     return 0; /* indicates successful termination */
20 } /* end main */
21
22
23 /* calculate cube of *nPtr; modifies variable number in main */
24 void cubeByReference( int *nPtr )
25 {
26     *nPtr = *nPtr * *nPtr * *nPtr; /* cube *nPtr */
27 } /* end function cubeByReference */

```

Function prototype takes a pointer argument

Function **cubeByReference** is passed an address, which can be the value of a pointer variable

In this program, **\*nPtr** is **number**, so this statement modifies the value of **number** itself.

The original value of number is 5  
The new value of number is 125

Step 1: Before main calls cubeByValue:

Step 2: After cubeByValue receives the call:

Step 3: After cubeByValue cubes parameter n and before cubeByValue returns to main:

Step 4: After cubeByValue returns to main and before assigning the result to number:

Step 5: After main completes the assignment to number:

**Fig. 7.8** | Analysis of a typical call-by-value.

Step 1: Before main calls cubeByReference:

```
int main( void )
{
    int number = 5;
    cubeByReference( &number );
}
```

number

5

```
void cubeByReference( int *nPtr )
{
    *nPtr = *nPtr * *nPtr * *nPtr;
}
```

nPtr

undefined

Step 2: After cubeByReference receives the call and before \*nPtr is cubed:

```
int main( void )
{
    int number = 5;
    cubeByReference( &number );
}
```

number

5

```
void cubeByReference( int *nPtr )
{
    *nPtr = *nPtr * *nPtr * *nPtr;
}
```

nPtr

call establishes this pointer

Step 3: After \*nPtr is cubed and before program control returns to main:

```
int main( void )
{
    int number = 5;
    cubeByReference( &number );
}
```

number

125

```
void cubeByReference( int *nPtr )
{
    *nPtr = *nPtr * *nPtr * *nPtr;
}
```

nPtr

called function modifies caller's variable

**Fig. 7.9** | Analysis of a typical call-by-reference with a pointer argument.

## Error-Prevention Tip 7.2

---

**Use call-by-value to pass arguments to a function unless the caller explicitly requires the called function to modify the value of the argument variable in the caller's environment. This prevents accidental modification of the caller's arguments and is another example of the principle of least privilege.**

## 7.5 Using the const Qualifier with Pointers

- **const qualifier**
  - Variable cannot be changed
  - Use **const** if function does not need to change a variable
  - Attempting to change a **const** variable produces an error
- **const pointers**
  - Point to a constant memory location
  - Must be initialized when defined
  - `int *const myPtr = &x;`
    - Type `int *const` – constant pointer to an `int`
  - `const int *myPtr = &x;`
    - Modifiable pointer to a `const int`
  - `const int *const Ptr = &x;`
    - `const` pointer to a `const int`
    - `x` itself can be changed, but not `*Ptr`

# Software Engineering Observation 7.1

---

**The `const` qualifier can be used to enforce the principle of least privilege. Using the principle of least privilege to properly design software reduces debugging time and improper side effects, making a program easier to modify and maintain.**

## Portability Tip 7.1

---

**Although `const` is well defined in Standard C, some compilers do not enforce it.**

## Error-Prevention Tip 7.3

---

**If a variable does not (or should not) change in the body of a function to which it is passed, the variable should be declared `const` to ensure that it is not accidentally modified.**

## Software Engineering Observation 7.2

---

**Only one value can be altered in a calling function when call-by-value is used. That value must be assigned from the return value of the function. To modify multiple values in a calling function, call-by-reference must be used.**

## Error-Prevention Tip 7.4

---

**Before using a function, check its function prototype to determine if the function is able to modify the values passed to it.**

## Common Programming Error 7.4

---

**Being unaware that a function is expecting pointers as arguments for call-by-reference and passing arguments call-by-value. Some compilers take the values assuming they are pointers and dereference the values as pointers. At runtime, memory-access violations or segmentation faults are often generated. Other compilers catch the mismatch in types between arguments and parameters and generate error messages.**

---

## Outline

fig07\_10.c

(1 of 2)

```
1  /* Fig. 7.10: fig07_10.c
2     Converting lowercase letters to uppercase letters
3     using a non-constant pointer to non-constant data */
4
5  #include <stdio.h>
6  #include <ctype.h>
7
8  void convertToUppercase( char *sPtr ); /* prototype */
9
10 int main( void )
11 {
12     char string[] = "characters and $32.98"; /* initialize char array */
13
14     printf( "The string before conversion is: %s", string );
15     convertToUppercase( string );
16     printf( "\nThe string after conversion is: %s\n", string );
17
18     return 0; /* indicates successful termination */
19
20 } /* end main */
21
```

Both **sPtr** and **\*sPtr** are modifiable

## Outline

fig07\_10.c

(2 of 2)

```
22 /* convert string to uppercase letters */
23 void convertToUppercase( char *sPtr )
24 {
25     while ( *sPtr != '\0' ) { /* current character is not '\0' */
26
27         if ( islower( *sPtr ) ) { /* if character is lowercase, */
28             *sPtr = toupper( *sPtr ); /* convert to uppercase */
29         } /* end if */
30
31         ++sPtr; /* move sPtr to the next character */
32     } /* end while */
33
34 } /* end function convertToUppercase */
```

Both **sPtr** and **\*sPtr** are modified by the **convertToUppercase** function

The string before conversion is: characters and \$32.98  
The string after conversion is: CHARACTERS AND \$32.98

## Outline

fig07\_11.c

(1 of 2)

```
1  /* Fig. 7.11: fig07_11.c
2     Printing a string one character at a time using
3     a non-constant pointer to constant data */
4
5  #include <stdio.h>
6
7  void printCharacters( const char *sPtr );
8
9  int main( void )
10 {
11     /* initialize char array */
12     char string[] = "print characters of a string";
13
14     printf( "The string is:\n" );
15     printCharacters( string );
16     printf( "\n" );
17
18     return 0; /* indicates successful termination */
19
20 } /* end main */
21
```

Pointer variable **sPtr** is modifiable, but the data to which it points, **\*sPtr**, is not

## Outline

fig07\_11.c

(2 of 2)

```
22 /* sPtr cannot modify the character to which it points,  
23    i.e., sPtr is a "read-only" pointer */  
24 void printCharacters( const char *sPtr )  
25 {  
26     /* loop through entire string */  
27     for ( ; *sPtr != '\0'; sPtr++ ) { /* no initialization */  
28         printf( "%c", *sPtr );  
29     } /* end for */  
30  
31 } /* end function printCharacters */
```

**sPtr** is modified by function **printCharacters**

The string is:  
print characters of a string

## Outline

fig07\_12.c

```

1  /* Fig. 7.12: fig07_12.c
2     Attempting to modify data through a
3     non-constant pointer to constant data. */
4  #include <stdio.h>
5  void f( const int *xPtr ); /* prototype */
6
7
8  int main( void )
9  {
10     int y;      /* define y */
11
12     f( &y );    /* f attempts illegal modification */
13
14     return 0;   /* indicates successful termination */
15 } /* end main */
16
17
18 /* xPtr cannot be used to modify the
19    value of the variable to which it points */
20 void f( const int *xPtr )
21 {
22     *xPtr = 100; /* error: cannot modify a const object */
23 } /* end function f */

```

Pointer variable **xPtr** is modifiable, but the data to which it points, **\*xPtr**, is not

**\*xPtr** has the **const** qualifier, so attempting to modify its value causes an error

```

FIG07\_12.exe - 2 error(s), 0 warning(s)

## 7.6 Bubble Sort Using Call-by-Reference

- **Implement bubble sort using pointers**
  - Swap two elements
  - swap function must receive address (using &) of array elements
    - Array elements have call-by-value default
  - Using pointers and the \* operator, swap can switch array elements

- **Pseudocode**

*Initialize array*

*print data in original order*

*Call function bubble sort*

*print sorted array*

*Define bubble sort*

## Outline

fig07\_15.c

(1 of 3)

```
1  /* Fig. 7.15: fig07_15.c
2     This program puts values into an array, sorts the values into
3     ascending order, and prints the resulting array. */
4  #include <stdio.h>
5  #define SIZE 10
6
7  void bubbleSort( int * const array, const int size ); /* prototype */
8
9  int main( void )
10 {
11     /* initialize array a */
12     int a[ SIZE ] = { 2, 6, 4, 8, 10, 12, 89, 68, 45, 37 };
13
14     int i; /* counter */
15
16     printf( "Data items in original order\n" );
17
18     /* loop through array a */
19     for ( i = 0; i < SIZE; i++ ) {
20         printf( "%4d", a[ i ] );
21     } /* end for */
22
23     bubbleSort( a, SIZE ); /* sort the array */
24
25     printf( "\nData items in ascending order\n" );
26
27     /* loop through array a */
28     for ( i = 0; i < SIZE; i++ ) {
29         printf( "%4d", a[ i ] );
30     } /* end for */
```

31 printf( "\n" );
32
33
34 return 0; /* indicates successful termination */
35
36 } /* end main */
37
38 /* sort an array of integers using bubble sort algorithm */
39 void bubbleSort( int * const array, const int size )
40 {
41     void swap( int *element1Ptr, int *element2Ptr ); /* prototype */
42     int pass; /* pass counter */
43     int j;    /* comparison counter */
44
45     /* loop to control passes */
46     for ( pass = 0; pass < size - 1; pass++ ) {
47
48         /* loop to control comparisons during each pass */
49         for ( j = 0; j < size - 1; j++ ) {
50
51             /* swap adjacent elements if they are out of order */
52             if ( array[ j ] > array[ j + 1 ] ) {
53                 swap( &array[ j ], &array[ j + 1 ] );
54             } /* end if */
55
56         } /* end inner for */
57
58     } /* end outer for */
59
60 } /* end function bubbleSort */
```

## Outline

fig07\_15.c

(3 of 3)

```
61
62 /* swap values at memory locations to which element1Ptr and
63    element2Ptr point */
64 void swap( int *element1Ptr, int *element2Ptr )
65 {
66     int hold = *element1Ptr;
67     *element1Ptr = *element2Ptr;
68     *element2Ptr = hold;
69 } /* end function swap */
```

Function **swap** changes the values of the **ints** that the two pointers point to

Data items in original order

2 6 4 8 10 12 89 68 45 37

Data items in ascending order

2 4 6 8 10 12 37 45 68 89

# Software Engineering Observation 7.3

---

**Placing function prototypes in the definitions of other functions enforces the principle of least privilege by restricting proper function calls to the functions in which the prototypes appear.**

## Software Engineering Observation 7.4

---

**When passing an array to a function, also pass the size of the array. This helps make the function reusable in many programs.**

# Software Engineering Observation 7.5

---

**Global variables usually violate the principle of least privilege and can lead to poor software engineering. Global variables should be used only to represent truly shared resources, such as the time of day.**

## 7.7 sizeof Operator

- **sizeof**

- Returns size of operand in bytes
- For arrays: size of 1 element \* number of elements
- if `sizeof( int )` equals 4 bytes, then

```
int myArray[ 10 ];  
printf( "%d", sizeof( myArray ) );
```

- will print 40

- **sizeof can be used with**

- Variable names
- Type name
- Constant values

## Outline

fig07\_16.c

```

1  /* Fig. 7.16: fig07_16.c
2      Sizeof operator when used on an array name
3      returns the number of bytes in the array. */
4  #include <stdio.h>
5
6  size_t getSize( float *ptr ); /* prototype */
7
8  int main( void )
9  {
10     float array[ 20 ]; /* create array */
11
12     printf( "The number of bytes in the array is %d"
13            "\nThe number of bytes returned by getSize is %d\n",
14            sizeof( array ), getSize( array ) );
15
16     return 0; /* indicates successful termination */
17
18 } /* end main */
19
20 /* return size of ptr */
21 size_t getSize( float *ptr )
22 {
23     return sizeof( ptr );
24
25 } /* end function getSize */

```

← floats take up 4 bytes in memory, so 20 floats take up 80 bytes

The number of bytes in the array is 80  
The number of bytes returned by getSize is 4

## Performance Tip 7.2

---

**sizeof** is a compile-time operator, so it does not incur any execution-time overhead.

## Portability Tip 7.2

---

**The number of bytes used to store a particular data type may vary between systems. When writing programs that depend on data type sizes and that will run on several computer systems, use `sizeof` to determine the number of bytes used to store the data types.**

## Outline

sizeof ld = 8     sizeof(long double) = 8
sizeof array = 80
sizeof ptr = 4

```

## 7.8 Pointer Expressions and Pointer Arithmetic

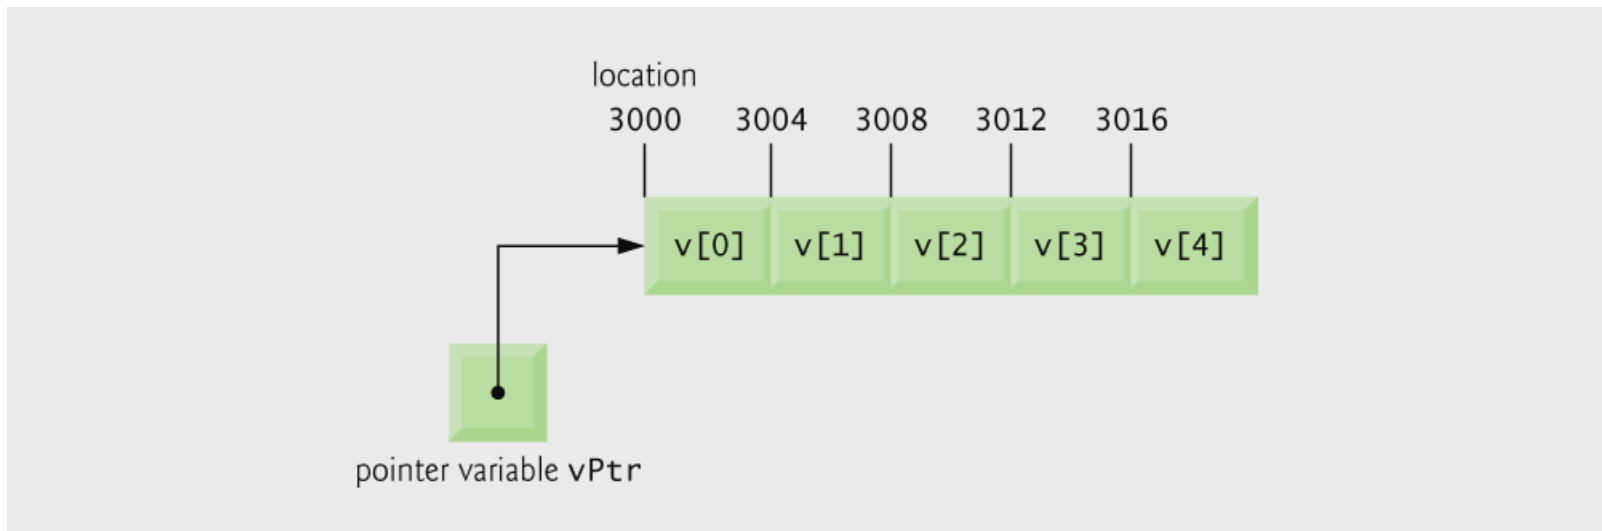

- **Arithmetic operations can be performed on pointers**
  - Increment/decrement pointer (**++** or **--**)
  - Add an integer to a pointer( **+** or **+=** , **-** or **-=**)
  - Pointers may be subtracted from each other
  - Operations meaningless unless performed on an array

## 7.8 Pointer Expressions and Pointer Arithmetic

- **5 element `int` array on machine with 4 byte `ints`**
  - **`vPtr` points to first element `v[ 0 ]`**
    - at location 3000 (`vPtr = 3000`)
  - **`vPtr += 2`; sets `vPtr` to 3008**
    - `vPtr` points to `v[ 2 ]` (incremented by 2), but the machine has 4 byte `ints`, so it points to address 3008

**Fig. 7.18** | Array **v** and a pointer variable **vPtr** that points to **v**.

**Fig. 7.19** | The pointer **vPtr** after pointer arithmetic.

## Portability Tip 7.3

---

**Most computers today have 2-byte or 4-byte integers. Some of the newer machines use 8-byte integers. Because the results of pointer arithmetic depend on the size of the objects a pointer points to, pointer arithmetic is machine dependent.**

## 7.8 Pointer Expressions and Pointer Arithmetic

- **Subtracting pointers**

- Returns number of elements from one to the other. If

`vPtr2 = v[ 2 ];`

`vPtr = v[ 0 ];`

- `vPtr2 - vPtr` would produce 2

- **Pointer comparison ( <, == , > )**

- See which pointer points to the higher numbered array element
- Also, see if a pointer points to 0

# Common Programming Error 7.5

---

**Using pointer arithmetic on a pointer that does not refer to an element in an array.**

# Common Programming Error 7.6

---

**Subtracting or comparing two pointers that do not refer to elements in the same array.**

# Common Programming Error 7.7

---

**Running off either end of an array when using pointer arithmetic.**

## 7.8 Pointer Expressions and Pointer Arithmetic

- **Pointers of the same type can be assigned to each other**
  - **If not the same type, a cast operator must be used**
  - **Exception: pointer to void (type void \*)**
    - **Generic pointer, represents any type**
    - **No casting needed to convert a pointer to void pointer**
    - **void pointers cannot be dereferenced**

# Common Programming Error 7.8

---

**Assigning a pointer of one type to a pointer of another type if neither is of type `void *` is a syntax error.**

# Common Programming Error 7.9

---

**Dereferencing a `void *` pointer is a syntax error.**

## 7.9 Relationship Between Pointers and Arrays

- **Arrays and pointers closely related**
  - Array name like a constant pointer
  - Pointers can do array subscripting operations
- **Define an array `b[ 5 ]` and a pointer `bPtr`**
  - To set them equal to one another use:  
`bPtr = b;`
    - The array name (`b`) is actually the address of first element of the array `b[ 5 ]`  
`bPtr = &b[ 0 ]`
    - Explicitly assigns `bPtr` to address of first element of `b`

## 7.9 Relationship Between Pointers and Arrays

- **Element  $b[3]$**

- Can be accessed by  $*(bPtr + 3)$

Where 3 is called the offset. Called pointer/offset notation

- Can be accessed by  $bPtr[3]$

Called pointer/subscript notation

$bPtr[3]$  same as  $b[3]$

- Can be accessed by performing pointer arithmetic on the array itself
- $*(b + 3)$

# Common Programming Error 7.10

---

**Attempting to modify an array name with pointer arithmetic is a syntax error.**

43     } /* end for */
44
45 } /* end function copy2 */

```

Condition of **for** loop  
actually performs an action

```

string1 = Hello
string3 = Good Bye

```

## 7.10 Arrays of Pointers

- **Arrays can contain pointers**
- **For example: an array of strings**

```
char *suit[ 4 ] = { "Hearts", "Diamonds",  
                  "Clubs", "Spades" };
```

- **Strings are pointers to the first character**
- **char \* – each element of `suit` is a pointer to a char**
- **The strings are not actually stored in the array `suit`, only pointers to the strings are stored**

**Fig. 7.22** | Graphical representation of the `suit` array.

## 7.11 Case Study: Card Shuffling and Dealing Simulation

- **Card shuffling program**
  - Use array of pointers to strings
  - Use double subscripted array (suit, face)
  - The numbers 1-52 go into the array
    - Representing the order in which the cards are dealt

## Performance Tip 7.3

---

**Sometimes an algorithm that emerges in a “natural” way can contain subtle performance problems, such as indefinite postponement. Seek algorithms that avoid indefinite postponement.**

**Fig. 7.23** | Double-subscripted array representation of a deck of cards.

# 7.11 Case Study: Card Shuffling and Dealing Simulation

## ■ Pseudocode

### — Top level:

*Shuffle and deal 52 cards*

### — First refinement:

*Initialize the suit array*

*Initialize the face array*

*Initialize the deck array*

*Shuffle the deck*

*Deal 52 cards*

# 7.11 Case Study: Card Shuffling and Dealing Simulation

- Second refinement

- Convert *shuffle the deck* to

- For each of the 52 cards*

- Place card number in randomly selected unoccupied slot of deck*

- Convert *deal 52 cards* to

- For each of the 52 cards*

- Find card number in deck array and print face and suit of card*

## 7.11 Case Study: Card Shuffling and Dealing Simulation

- **Third refinement**

- Convert *shuffle the deck* to

- Choose slot of deck randomly*

- While chosen slot of deck has been previously chosen*

- Choose slot of deck randomly*

- Place card number in chosen slot of deck*

- Convert *deal 52 cards* to

- For each slot of the deck array*

- If slot contains card number*

- Print the face and suit of the card*

## 7.12 Pointers to Functions

- **Pointer to function**
  - Contains address of function
  - Similar to how array name is address of first element
  - Function name is starting address of code that defines function
- **Function pointers can be**
  - Passed to functions
  - Stored in arrays
  - Assigned to other function pointers

## 7.12 Pointers to Functions

### ■ Example: bubblesort

- Function `bubble` takes a function pointer
  - `bubble` calls this helper function
  - this determines ascending or descending sorting
- The argument in `bubblesort` for the function pointer:  
`int ( *compare )( int a, int b )`  
tells `bubblesort` to expect a pointer to a function that takes two `ints` and returns an `int`
- If the parentheses were left out:  
`int *compare( int a, int b )`
  - Defines a function that receives two integers and returns a pointer to a `int`

## Outline

fig07\_26.c

(1 of 4)

```

1  /* Fig. 7.26: fig07_26.c
2      Multipurpose sorting program using function pointers */
3  #include <stdio.h>
4  #define SIZE 10
5
6  /* prototypes */
7  void bubble( int work[], const int size, int (*compare)( int a, int b ) );
8  int ascending( int a, int b );
9  int descending( int a, int b );
10
11 int main( void )
12 {
13     int order;    /* 1 for ascending order or 2 for descending order */
14     int counter; /* counter */
15
16     /* initialize array a */
17     int a[ SIZE ] = { 2, 6, 4, 8, 10, 12, 89, 68, 45, 37 };
18
19     printf( "Enter 1 to sort in ascending order,\n"
20            "Enter 2 to sort in descending order: " );
21     scanf( "%d", &order );
22
23     printf( "\nData items in original order\n" );
24
25     /* output original array */
26     for ( counter = 0; counter < SIZE; counter++ ) {
27         printf( "%5d", a[ counter ] );
28     } /* end for */
29

```

**bubble** function takes a function pointer as an argument

## Outline

fig07\_26.c

(2 of 4)

```
30  /* sort array in ascending order; pass function ascending as an
31     argument to specify ascending sorting order */
32  if ( order == 1 ) {
33     bubble( a, SIZE, ascending );
34     printf( "\nData items in ascending order\n" );
35 } /* end if */
36 else { /* pass function descending */
37     bubble( a, SIZE, descending );
38     printf( "\nData items in descending order\n" );
39 } /* end else */
40
41 /* output sorted array */
42 for ( counter = 0; counter < SIZE; counter++ ) {
43     printf( "%5d", a[ counter ] );
44 } /* end for */
45
46 printf( "\n" );
47
48 return 0; /* indicates successful termination */
49
50 } /* end main */
51
```

depending on the user's choice, the **bubble** function uses either the **ascending** or **descending** function to sort the array

## Outline

fig07\_26.c

(3 of 4)

```

52 /* multipurpose bubble sort; parameter compare is a pointer to
53    the comparison function that determines sorting order */
54 void bubble( int work[], const int size, int (*compare)( int a, int b ) )
55 {
56     int pass; /* pass counter */
57     int count; /* comparison counter */
58
59     void swap( int *element1Ptr, int *element2ptr ); /* prototype */
60
61     /* loop to control passes */
62     for ( pass = 1; pass < size; pass++ ) {
63
64         /* loop to control number of comparisons per pass */
65         for ( count = 0; count < size - 1; count++ ) {
66
67             /* if adjacent elements are out of order, swap them */
68             if ( (*compare)( work[ count ], work[ count + 1 ] ) ) {
69                 swap( &work[ count ], &work[ count + 1 ] );
70             } /* end if */
71
72         } /* end for */
73
74     } /* end for */
75
76 } /* end function bubble */
77

```

Note that what the program considers “out of order” is dependent on the function pointer that was passed to the **bubble** function

## Outline

fig07\_26.c

(4 of 4)

```
78 /* swap values at memory locations to which element1Ptr and
79    element2Ptr point */
80 void swap( int *element1Ptr, int *element2Ptr )
81 {
82     int hold; /* temporary holding variable */
83
84     hold = *element1Ptr;
85     *element1Ptr = *element2Ptr;
86     *element2Ptr = hold;
87 } /* end function swap */
88
89 /* determine whether elements are out of order for an ascending
90    order sort */
91 int ascending( int a, int b ) ←
92 {
93     return b < a; /* swap if b is less than a */
94
95 } /* end function ascending */
96
97 /* determine whether elements are out of order for a descending
98    order sort */
99 int descending( int a, int b ) ←
100 {
101     return b > a; /* swap if b is greater than a */
102
103 } /* end function descending */
```

Passing the **bubble** function **ascending**  
will point the program here

Passing the **bubble** function **descending**  
will point the program here

## Outline

Enter 1 to sort in ascending order,  
Enter 2 to sort in descending order: 1

Data items in original order

2    6    4    8    10    12    89    68    45    37

Data items in ascending order

2    4    6    8    10    12    37    45    68    89

Enter 1 to sort in ascending order,  
Enter 2 to sort in descending order: 2

Data items in original order

2    6    4    8    10    12    89    68    45    37

Data items in descending order

89    68    45    37    12    10    8    6    4    2

## Outline

fig07\_28.c

(1 of 3)

```
1  /* Fig. 7.28: fig07_28.c
2     Demonstrating an array of pointers to functions */
3  #include <stdio.h>
4
5  /* prototypes */
6  void function1( int a );
7  void function2( int b );
8  void function3( int c );
9
10 int main( void )
11 {
12     /* initialize array of 3 pointers to functions that each take an
13        int argument and return void */
14     void (*f[ 3 ])( int ) = { function1, function2, function3 };
15
16     int choice; /* variable to hold user's choice */
17
18     printf( "Enter a number between 0 and 2, 3 to end: " );
19     scanf( "%d", &choice );
20
```

Array of pointers to functions

## Outline

fig07\_28.c

(2 of 3)

```
21  /* process user's choice */
22  while ( choice >= 0 && choice < 3 ) {
23
24      /* invoke function at location choice in array f and pass
25         choice as an argument */
26      (*f[ choice ])( choice );
27
28      printf( "Enter a number between 0 and 2, 3 to end: " );
29      scanf( "%d", &choice );
30  } /* end while */
31
32  printf( "Program execution completed.\n" );
33
34  return 0; /* indicates successful termination */
35
36 } /* end main */
37
38 void function1( int a )
39 {
40     printf( "You entered %d so function1 was called\n\n", a );
41 } /* end function1 */
42
43 void function2( int b )
44 {
45     printf( "You entered %d so function2 was called\n\n", b );
46 } /* end function2 */
```

Function called is dependent on user's choice

## Outline

fig07\_28.c

(3 of 3)

```
47
48 void function3( int c )
49 {
50     printf( "You entered %d so function3 was called\n\n", c );
51 } /* end function3 */
```

Enter a number between 0 and 2, 3 to end: 0  
You entered 0 so function1 was called

Enter a number between 0 and 2, 3 to end: 1  
You entered 1 so function2 was called

Enter a number between 0 and 2, 3 to end: 2  
You entered 2 so function3 was called

Enter a number between 0 and 2, 3 to end: 3  
Program execution completed.
